

Deployment and Operations Guide

Customer-safe instructions for verification, installation, activation, first use, upgrades, and support

Version 1.0 | August 2026

Audience

Client IT, security teams, project managers, and accountable system owners. This guide contains no internal build procedures or signing secrets.

What this guide covers

Use this guide from receipt of the customer delivery through operational acceptance. Retain it with the installation records and the separately supplied verification information.

Receive and verify	Confirm the delivery arrived unchanged
Install and activate	Create an entitled local installation
Configure and validate	Confirm approved storage, connections, and evidence output
Operate and maintain	Apply integrity, upgrade, backup, support, and uninstall controls

1. Before installation

System requirements

Operating system	Windows 10 or Windows 11, 64-bit
Memory	16 GB minimum; 32 GB recommended for local-model work
Disk	At least 8 GB free, plus space for datasets and evidence packages
GPU	Optional; 8 GB VRAM or more improves local inference speed
Network	Optional for local operation; required only for selected cloud or remote connections
Privileges	Local administrator approval is required for installation

Expected delivery contents

VERITROOPER Audit Suite Setup.exe	Installer launcher
Setup-1.bin, Setup-2.bin, Setup-3.bin	Numbered installer payload files; all are required
veritrooper-activation.vtlic	Signed customer activation
SHA256SUMS.txt or verification code	Independent integrity reference
Installation instructions, this guide, and user manual	Deployment and operating documentation

Keep the installer together
Place Setup.exe and all three numbered .bin files in the same local folder. Do not rename them and do not run Setup from inside a compressed archive or an online-only sync placeholder.

2. Verify the delivery

- 1 Obtain the expected installer hash or verification code through a trusted channel separate from the file transfer.
- 2 If VERIFY VERITROOPER INSTALLER.cmd is included, double-click it and continue only when it reports VERIFIED - THE INSTALLER MATCHES.
- 3 Otherwise, calculate SHA-256 hashes and compare them with the supplied manifest. A single differing character is a failure.
- 4 Confirm the delivery contains the expected customer name and activation, and contains no material intended for another customer.
- 5 If Windows shows a publisher warning, follow the release-specific instructions. Do not use a warning as a substitute for hash verification.

Optional manual verification

```
Get-FileHash ".\VERITROOPER Audit Suite Setup.exe" -Algorithm SHA256
```

Stop condition

Do not install if a file is missing, a filename changed, a hash differs, the customer identity is wrong, or the activation appears altered. Contact VERITROOPER before proceeding.

Transfer handling

- Store the delivery in a client-controlled location with access limited to authorized deployment personnel.
- If the package is encrypted, receive the password through a different trusted channel.
- Retain the verified original delivery and manifest until deployment acceptance is complete.

3. Install and activate

- 1 Copy all installer parts and veritrooper-activation.vtlic into one local folder.
- 2 Right-click VERITROOPER Audit Suite Setup.exe and choose Run as administrator.
- 3 Complete Setup. The numbered .bin files are opened automatically; do not launch them directly.
- 4 Launch VERITROOPER Audit Suite from the desktop or Start menu. The local console opens in the default browser on 127.0.0.1.
- 5 Confirm the displayed customer, capabilities, access type, limits, and expiration match the purchase or evaluation agreement.

Activation fallback

When the signed activation is beside Setup, it is installed automatically. If it is not recognized, open Install or Update Activation from the VERITROOPER Start menu and select the supplied .vtlic file.

Data and network behavior

- Local or air-gapped operation keeps model prompts and answers on this computer.
- Selecting a cloud or remote connection sends the confirmed data to that provider under the client's account, terms, and security controls.
- VERITROOPER does not operate a hosted service that receives the client's audit data.
- Never put passwords or API keys in audit names, notes, screenshots, or support messages.

4. Configure and validate

Storage and access

- Choose controlled dataset and output locations appropriate to the information sensitivity.
- Confirm authorized users can write evidence packages and that sufficient space is available.
- Apply the organization's backup, encryption, retention, and deletion policies to source data and outputs.

Connections

- Configure only providers and endpoints approved by the organization.
- Use the Connections screen to add credentials; do not place secrets in datasets or documentation.
- Test the connection before a production audit and review what data will be sent at confirmation.

First smoke audit

- 1 Use approved, non-sensitive sample material.
- 2 Select the intended workflow and connection, then review the final confirmation screen.
- 3 Allow the run to finish without closing the console or interrupting the selected model.
- 4 Confirm the output contains customer-readable reports, machine-readable records, and an Integrity folder.
- 5 Open the Integrity folder and run Check this package.bat. Compare the signer fingerprint with the fingerprint supplied through a trusted channel.

Evidence rule

Treat an unsealed, seal-withheld, signature-failed, or modified package as non-deliverable until the cause is resolved. A completed report is not the same as a verified evidence package.

5. Operational acceptance

Product identity	Version and activation details recorded
Storage	Approved dataset/output paths and permissions recorded
Connections	Approved provider owner and successful connection test
Smoke audit	Successful output with no unexplained technical exclusions
Package integrity	Verification result and trusted signer comparison
Human review	Owners assigned for referrals, set-asides, and decisions
Records	Backup and retention policy applied
Support	Support owner and secure redaction/transfer procedure recorded

Operating responsibilities

- Review every result before using it for a decision.
- Preserve complete evidence-package folders rather than extracting individual reports.
- Document human decisions and sign-off against the recorded result fingerprint where applicable.
- Reverify packages received from another person, machine, or storage system.
- Record material configuration or provider changes before comparing results across time.

Limitations

VERITROOPER produces testing and governance evidence. It does not provide legal advice, perform a conformity assessment, certify compliance, prove the absence of error, or replace accountable human review.

6. Upgrade, recovery, and uninstall

Upgrade

- 1 Back up evidence, configuration records, and the current signed activation according to policy.
- 2 Verify the new release and review its release-specific instructions.
- 3 Close VERITROOPER, then run the new Setup as administrator with all numbered payload files present.
- 4 Confirm activation, approved connections, storage paths, a smoke audit, and package integrity after the upgrade.
- 5 Retain the prior approved installer until the new release passes acceptance.

Recovery or rollback

Do not replace installed files manually. Contact the deployment owner or VERITROOPER support. Preserve affected evidence and logs, document the reason for recovery, and repeat acceptance after any reinstall.

Uninstall

- 1 Decide which evidence packages, datasets, exports, and logs must be retained or securely destroyed.
- 2 Use Windows Installed apps or the VERITROOPER Start-menu uninstall shortcut.
- 3 Review customer-created data separately. Do not assume uninstall removes every external dataset or evidence folder.
- 4 Record completion under the organization's records and asset-disposal policy.

Support

Email brianb@veritrooper.com. Include the VERITROOPER version, Windows version, affected screen, exact message, redacted reproduction steps, and integrity-verification result. Never send API keys or sensitive source material unless an approved secure transfer has been arranged.

7. Client acceptance record

[]	All installer files received together and hashes verified
[]	Administrative installation completed
[]	Correct customer activation and capabilities confirmed
[]	Controlled dataset and output locations selected
[]	Only approved remote connections configured
[]	Smoke audit completed
[]	Evidence-package integrity verified
[]	Human-review, retention, backup, and support owners assigned
